

A vehicle in a black hole

Brave astronaut John was about to take off with his big rocket into outer space to explore some planets and galaxies. Despite his excitement, he felt a little afraid because he had to pass near a giant and mysterious black hole. Fortunately, his rocket is equipped with the best emergency tools to avoid any potential problems.

After the countdown, John set off on his long journey of discovery. Along the way, he was talking through the transmitter with the command room. He told them that he wanted to see the black hole up close to discover its mysterious and dangerous secret, so they agreed to his request. John happily flew towards the black hole, but when he got close to it, he could not pick up the signal when trying to contact the command room. Then he knew that his end might be near, so he tried to change its course and increase the speed of the missile, but to no avail. He felt a force pulling him towards the black hole, and he repeatedly tried to contact the command room, but to no avail.

In a moment of desperation, John decided not to get off his rocket using the jetpack for fear of certain death. He lost control of his rocket, which was swallowed by the black hole. Meanwhile, maintenance workers had developed a tracking device and noticed that John's missile had disappeared, and no information was known about it from that moment on.

20 years later, a miracle occurred that changed the lives of John and the NASA crew. One of the workers was sitting in the command room and saw something on the map in front of him. Upon checking, they discovered that John's rocket had exited the black hole, heading toward Earth. The worker called his colleagues to witness this sudden event. When the rocket arrived, all NASA workers celebrated John's return. They congratulated him for his courage and facing all obstacles to return to where his loved ones and family were.
